

Embed a video from Yuja into your Moodle course

Embedding a video is the best way to insert a video into your Moodle course since it basically places a link to wherever the video is located on the internet and not in your actual course. That means it doesn't take up file space on our Moodle server and students see the video itself right in Moodle.

You can embed a video in any Moodle type of activity or resource that contains an editing window.

Don't panic when you see what is in the HTML source editor window. (see image below)

Most people never work with html code and don't need to do so.

The little bit you need to understand is that basically what you see inside of the symbols < > is code used in web pages to set up formatting (such as bold, underline, new paragraph, etc.)

Example: <p> </p> code is paragraph code that is sort of like striking the Enter key

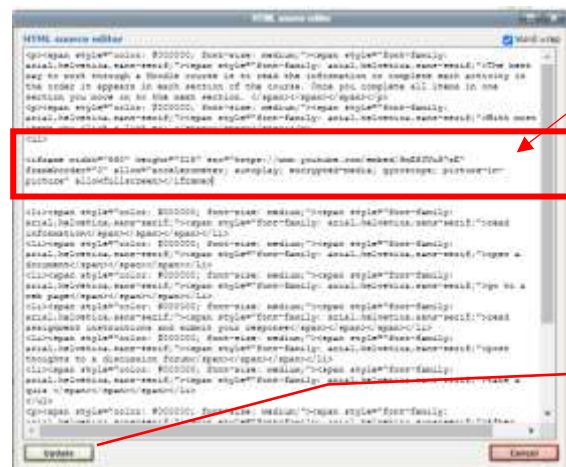

To figure out where you want to place your video, just look for the words you actually had typed that are outside of the < > codes to help you locate the position where you want to place your embedded video.

Step 7:

In the HTML editor window, place your cursor where you want the video to appear, and **paste** the embed code you copied from YouTube into the place where you want it to appear.

***Note:** I like to strike the Enter key a couple of times before pasting so the embed code is easy to find in the window in case I ever want to delete the video..*

Note Two common ways to paste something you have copied:

- right click for a drop-down menu to appear that includes the paste choice
- hold the Ctrl key down as you press the letter "V"

Example of where my embed code was placed.

Step 8:

Click **Update**.

Your video will then appear in your editing window. Click **Save changes** and you are done.
