

Electrophilic

Aromatic

Substitution

Benzene

- Source of electrons -thus- a **base**
- Other reactants are **deficient** in electrons - thus- **electrophilic reagents** or **acids**
- Typical reactions of benzene rings are **electrophilic substitution reactions**

ELECTROPHILIC AROMATIC SUBSTITUTION

Ar = *aryl*, any aromatic group with attachment directly to ring carbon

1. Nitration.

Discussed in Sec. 15.8.

2. Sulfonation.

Discussed in Sec. 15.9.

3. Halogenation.

Discussed in Sec. 15.11.

4. Friedel-Crafts alkylation.

Discussed in Sec. 15.10.

5. **Friedel-Crafts acylation.** Discussed in Sec. 18.5.

6. **Protonation.** Discussed in Sec. 15.12.

7. **Nitrosation.** Discussed in Secs. 23.11 and 24.11.

8. **Diazo coupling.** Discussed in Sec. 23.18.

9. **Kolbe reaction.** Discussed in Sec. 24.12.

Only for phenols

10. **Reimer-Tiemann reaction.** Discussed in Sec. 24.13.

Only for phenols ■

Effect of Substituent Groups

- Substituted groups direct the attach of a second group to the *ortho* or *para* positions
- Substitued groups direct the attach of a second group to the *meta* position
- Affects reactivity
- Affects orientation

Activating groups -
make the ring more reactive

Deactivating group -
makes the ring less reactive

A spiral-bound notebook page with a light cream background and a dark brown cover. A horizontal line is drawn across the page. Below the line, there are two ovals. The top oval is light green and contains the text "Ortho, para director". The bottom oval is light red and contains the text "Meta director".

Ortho, para director

Meta director

Effect of Groups on Electrophilic Aromatic Substitution

Activating: Ortho,para directors

Strongly activating

-NH₂ (-NRH, -NR₂)

-OH

Effect of Groups on Electrophilic Aromatic Substitution

Activating: Ortho,para directors

Moderately activating

-OCH₃ (-OC₂H₅, etc.)

-NHCOCH₃

Effect of Groups on Electrophilic Aromatic Substitution

Activating: Ortho,para directors

Weakly activating

- C₆H₅

-CH₃ (-C₂H₅, etc.)

Effect of Groups on Electrophilic Aromatic Substitution

Deactivating: Meta directors

Effect of Groups on Electrophilic Aromatic Substitution

- Deactivating: Ortho,para directors
-F, -Cl, -Br, -I

Table 15.3 EFFECT OF GROUPS ON ELECTROPHILIC AROMATIC SUBSTITUTION

Activating: *Ortho, para* directors

Strongly activating

Moderately activating

Weakly activating

Deactivating: *Meta* directors

Deactivating: *Ortho, para* directors

Orientation in Disubstituted Benzenes

- Strongly activating groups generally win out over deactivating or weakly activating groups.
- There is often little substitution between two groups that are meta to each other.

15.6 Orientation in disubstituted benzenes

The presence of two substituents on a ring makes the problem of orientation more complicated, but even here we can frequently make very definite predictions.

First of all, the two substituents may be located so that the directive influence of one *reinforces* that of the other; for example, in I, II, and III the orientation clearly must be that indicated by the arrows.

I

II

III

On the other hand, when the directive effect of one group *opposes* that of the other, it may be difficult to predict the major product; in such cases complicated mixtures of several products are often obtained.

Even where there are opposing effects, however, it is still possible in certain cases to make predictions in accordance with the following generalizations.

(a) *Strongly activating groups generally win out over deactivating or weakly activating groups.* The differences in directive power in the sequence

are great enough to be used in planning feasible syntheses. For example:

There must be, however, a fairly large difference in the effects of the two groups for clear-cut results; otherwise one gets results like these:

(b) *There is often little substitution between two groups that are meta to each other.* In many cases it seems as though there just is not enough room between two groups located *meta* to each other for appreciable substitution to occur there, as illustrated by IV and V:
