Benzene

- Source of electrons -thus- a base
- Other reactants are deficient in electrons -thus- electrophilic reagents or acids
- Typical reactions of benzene rings are electrophilic substitution reactions

ELECTROPHILIC AROMATIC SUBSTITUTION _____

Ar = aryl, any aromatic group with attachment directly to ring carbon

1. Nitration. Discussed in Sec. 15.8.

$$\begin{array}{ccccc} ArH & + & HONO_2 & \xrightarrow{\quad H_2SO_4 \quad} & Ar \xrightarrow{\quad NO_2 \quad} & + & H_2O \\ & & A & nitro \ compound \end{array}$$

2. Sulfonation. Discussed in Sec. 15.9.

$$\begin{array}{ccccc} ArH & + & HOSO_3H & \xrightarrow{SO_3} & Ar \xrightarrow{SO_3H} & + & H_2O \\ & & & A \ sulfonic \ acid \end{array}$$

3. Halogenation. Discussed in Sec. 15.11.

$$\begin{array}{cccc} ArH \ + \ Cl_2 & \xrightarrow{Fe} & Ar - \xrightarrow{\hbox{\it Cl}} \ + \ HCl \\ & & An \ aryl \ chloride \end{array}$$

$$ArH + Br_2 \xrightarrow{Fe} Ar - Br + HBr$$
An aryl bromide

4. Friedel-Crafts alkylation. Discussed in Sec. 15.10.

$$ArH + RCl \xrightarrow{AlCl_3} Ar - R + HCl$$
An alkylbenzene

5. Friedel-Crafts acylation. Discussed in Sec. 18.5.

$$\begin{array}{ccc} \text{ArH} & + & \text{RCOCl} & \xrightarrow{\text{AlCl}_3} & \text{Ar-} \xrightarrow{\text{COR}} & + & \text{HCl} \\ & \text{An acyl chloride} & & \text{A ketone} \end{array}$$

6. Protonation. Discussed in Sec. 15.12.

7. Nitrosation. Discussed in Secs. 23.11 and 24.11.

$$ArH + HONO \longrightarrow Ar - N = O + H_2O$$

A nitroso compound

Only for highly reactive ArH

8. Diazo coupling. Discussed in Sec. 23.18.

- 9. Kolbe reaction. Discussed in Sec. 24.12.
- 10. Reimer-Tiemann reaction. Discussed in Sec. 24.13.
- Only for phenols

Only for phenols

Effect of Substituent Groups

- Substitued groups direct the attach of a second group to the *ortho* or *para* positions
- Affects reactivity
- Affects orientation

Effect of Groups on Electrophilic Aromatic Substitution

Activating: Ortho,para directors Strongly activating -NH₂ (-NRH, -NR₂) -OH

```
Activating: Ortho, para directors
  Moderately activating
      -OCH_3 (-OC_2H_5, etc.)
      -NHCOCH<sub>3</sub>
Activating: Ortho, para directors
  Weakly activating
      -C_6H_5
      -CH_3(-C_2H_5, etc.)
Deactivating: Meta directors
     -NO<sub>2</sub>
      -N(CH_3)_3^+
      -CN
      -COOH (-COOR)
      -SO<sub>3</sub>H
      -CHO, -COR
• Deactivating: Ortho, para directors
                                                      -F, -Cl, -Br, -I
```

Table 15.3 EFFECT OF GROUPS ON ELECTROPHILIC AROMATIC SUBSTITUTION

```
Deactivating: Meta directors
Activating: Ortho, para directors
  Strongly activating
                                                    -NO_2
                                                    -N(CH_3)_3^+
    -NH_2 (-NHR, -NR_2)
                                                    -CN
    -OH
                                                    -COOH (-COOR)
                                                    -SO_3H
  Moderately activating
                                                    -CHO, -COR
    -OCH<sub>3</sub> (-OC<sub>2</sub>H<sub>5</sub>, etc.)
    -NHCOCH<sub>3</sub>
                                             Deactivating: Ortho, para directors
                                                    -F, -Cl, -Br, -I
  Weakly activating
    -C_6H_5
    -CH_3 (-C_2H_5, etc.)
```

15.6 Orientation in disubstituted benzenes

The presence of two substituents on a ring makes the problem of orientation more complicated, but even here we can frequently make very definite predictions.

First of all, the two substituents may be located so that the directive influence of one *reinforces* that of the other; for example, in I, II, and III the orientation clearly must be that indicated by the arrows.

$$O(1)$$
 $O(2)$
 $O(2)$
 $O(3)$
 $O(3)$

On the other hand, when the directive effect of one group *opposes* that of the other, it may be difficult to predict the major product; in such cases complicated mixtures of several products are often obtained.

Even where there are opposing effects, however, it is still possible in certain cases to make predictions in accordance with the following generalizations.

(a) Strongly activating groups generally win out over deactivating or weakly activating groups. The differences in directive power in the sequence

$$-NH_2$$
, $-OH > -OCH_3$, $-NHCOCH_3 > -C_6H_5$, $-CH_3 > meta$ directors

are great enough to be used in planning feasible syntheses. For example:

$$\begin{array}{c}
OH \\
OH \\
OH
\end{array}$$

$$\begin{array}{c}
OH \\
NO_{2} \\
CH_{3}
\end{array}$$

$$\begin{array}{c}
Sole \ product
\end{array}$$

$$\begin{array}{c}
NHCOCH_{3} \\
CH_{3}
\end{array}$$

$$\begin{array}{c}
Br_{2}, \ FeBr_{3} \\
CH_{3}
\end{array}$$

$$\begin{array}{c}
CHO \\
OH
\end{array}$$

$$\begin{array}{c}
CHO \\
OH
\end{array}$$

$$\begin{array}{c}
CHO \\
OH
\end{array}$$

$$\begin{array}{c}
CHO \\
Chief \ product
\end{array}$$

$$\begin{array}{c}
CHO \\
Chief \ product
\end{array}$$

$$\begin{array}{c}
CHO \\
Chief \ product
\end{array}$$

There must be, however, a fairly large difference in the effects of the two groups for clear-cut results; otherwise one gets results like these:

$$\begin{array}{c}
CH_3 \\
CI
\end{array}
\xrightarrow{\text{HNO}_3, \text{ H}_2\text{SO}_4}$$

$$\begin{array}{c}
CH_3 \\
OI
\end{array}$$

$$\begin{array}{c}
OI$$

$$OI$$

$$\begin{array}{c}
OI
\end{array}$$

$$\begin{array}{c}
OI
\end{array}$$

$$\begin{array}{c}
OI$$

$$OI$$

(b) There is often little substitution between two groups that are meta to each other. In many cases it seems as though there just is not enough room between two groups located meta to each other for appreciable substitution to occur there, as illustrated by IV and V:

Orientation in Disubstituted Benzenes

- Strongly activating groups generally win out over deactivating or weakly activating groups.
- There is often little substitution between two groups that are meta to each other.

Nitration
Sulfonation
Friedel-Crafts Alkylation
Halogenation
A Summary
